HUMANITI AI / RECRUITMENT CHALLENGE

Can You Teach AI to Recognise a Great Class?

AI Engineers & Senior Developers | 24-hour submission window | Expected effort: 4-5 hours

Challenge window

Starts: Wednesday, 6:00 PM **Submission deadline:** Friday, 12:00 PM

The challenge

An online education company, 8x8, conducts classes for children. Some classes are excellent, some good, some average, and others poor. We have a small set of recordings representing different levels of quality.

Your challenge: Build an AI-powered application that can assess the quality of an online class recording.

What makes one class better than another? Is it only what the teacher says, or could the way a class sounds and what happens on screen also matter? Which signals are meaningful, and which might be misleading? These are for you to explore. We are not prescribing what to examine or how to build the solution.

What we will give you

A small collection of sample 8x8 class recordings to study and compare.

Dataset link:
https://drive.google.com/drive/folders/1Jz2GlCg8zmdbdxeJweaW8UCY27vqXHr0?usp=drive_link

What we expect

Build a simple, working application that:

- Accepts a new class recording as input (upload or link).
- Classifies its quality as Poor, Average, Good, or Excellent.
- Explains its assessment with specific, useful observations rather than generic statements.

We will test your application with a recording you have not seen before. The system does not need to be perfect, but it should genuinely process the input and produce a reasoned result.

Your approach is up to you

Choose any appropriate AI tools, models, APIs, frameworks, or coding assistants, subject to the data-handling rules below. You do not need to train your own model or build a production-grade platform. A simple interface is enough. We are interested in your judgement, experimentation, and ability to make something work.

What to submit

- **Working application:** A hosted link where we can provide a recording and see the assessment. A simple Streamlit, Gradio, or similar prototype is fine.
- **Source code:** A GitHub repository with a short README explaining how to run it. Do not include secrets or credentials.
- **AI interaction history:** Relevant prompts and conversations from the AI assistants you used for research, development, and debugging. Share exports or available logs; redact personal information, credentials, and unrelated material.
- **Brief explanation (maximum 300 words):** Your chosen approach and why; what worked or failed; the main limitations.

Submit your output here

Google Form: https://docs.google.com/forms/d/e/1FAIpQLSemgdFdy8ijCNhKkkjhukNh71MCkfTEs2ho-3NWPEfc0j9KyQ/viewform

How we will evaluate your work

Evaluation area	Weight
Quality and usefulness of the AI assessment	35%
Working application and code quality	25%
Problem-solving and effective use of AI	30%
Clarity of approach	10%

Ground rules

- Submit within the challenge window above; the assignment is intended to take approximately 4-5 hours.
- This is individual work. AI assistance is encouraged; having another person complete the assignment is not.

- Keep recordings confidential. Do not publish, redistribute, or expose them through public applications or repositories. Process recordings only using services specifically permitted by the organiser, especially if children are identifiable.
- Make sure your submitted application and links are accessible for testing.

A final note

At Humaniti AI, we work on real business problems where the answer is not always obvious. We are looking for builders, researchers, and problem-solvers who can explore a problem, make sensible decisions, and deliver a practical result.

We are not testing how much code you can write in five hours. We are testing what you can accomplish with AI in five hours.

Team Humaniti AI
